

PRE-CUT ALUMINIUM CONSTRUCTION PACKAGES

Client Service

For our builders we are available whenever you need us. We understand that custom boatbuilding is a challenging business and we want you to feel we are an extension of your team. It is this commitment to our builders that keeps them coming back to us with new projects.

Pre-cut Construction Packages

Our kitting techniques are second to none. For over 15 years we have used the industries best marine software to build our vessel structures on our computers before any workshop fabrication commences. Our pre-cut designs are nested to minimise material waste and required extrusions are supplied with the pre-cut plate parts.

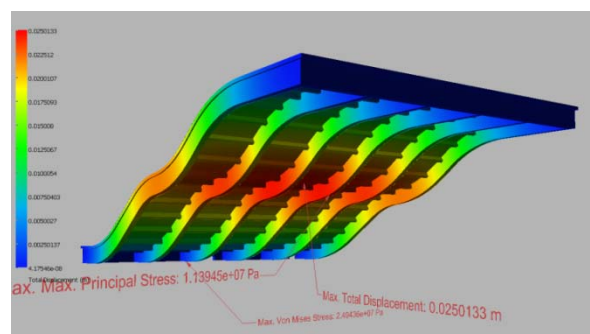

Project Management

For builders new to aluminium construction we can provide more than just a pre-cut vessel package with construction plans. Working in association with Alucraft (specialist aluminium boatbuilders since 1989) fabrication direction can also be provided.

FEA Analysis Capabilities

We were the first consultants in Australia to recognise the potential in Scan&Solve's unique FEA software. Integrated into our Rhino 3D modelling software we are now able to analyse and design complex structures faster and with more confidence than was previously possible.

Flexible Workforce

Whilst our core team is intentionally small, we have over the years developed alliances with other naval architects and engineering specialists that allow us to expand our workforce when required.
